

Repair Materials

Repairing textile fabrics is a cost effective way to extend the life of a garment. The Thermopatch range of repair materials is ideally suited for this application. Using our unique thermoplastic coating technology to apply an extremely thin and smooth adhesive layer, almost any material can be made into a repair patch.

Repair patches and rolls

Thermopatch have prepared an extensive selection of fabrics (such as 100% cotton and 65/35% poly/cotton) and colours for producing repair materials, which can be supplied in one of two methods:

Pre-cut individual patches in a range of sizes, from a small 13mm diameter circle, up to a large 100x100mm square, and many more in between.

Continuous rolls from 13mm to 150mm wide, allowing the user to cut the material to whatever size is required for the job.

For full details of the selection of colours, materials, and sizes available, please refer to our specifications document, or contact us.

Once sealed, repair patches are designed for permanent adhesion, and are able to withstand an industrial wash process up to 95°C.

Patching Film

Clear Patching Film from Thermopatch is a great alternative to repair patches where our range does not match your required fabric. Supplied on rolls of either 50mm or 100mm width, the user can simply cut the film and the material to the necessary size, then repair the garment using a heat sealing machine. Once completed, simply cut off any excess material. Clear Patching Film is designed for permanent adhesion and is able to withstand a 95°C industrial wash process.

Coating / Cutting of Material

In the event that you cannot find a matching material or colour in our range, or that patching film is unsuitable, there is an alternative method for producing repair materials. The versatility of our thermoplastic adhesive makes it possible for us to coat almost any fabric, which can then be cut into the required size. Please contact us for full details of our material coating and cutting service.
